RACKWARE

RMM – RackWare Management Module

May 2025

RackWare helps enterprises migrate to the cloud, protect their workloads through backup and disaster recovery, and assess environments for planning and viability

RackWare Hybrid Cloud Platform

Helping Customers on their Cloud Journey

Execution Phase

Cloud Migration

RackWare CloudMotion is a true Any-to-Any solution:

- Windows, Linux servers (VM + Physical)
- Kubernetes or OpenShift containers
- Datacenters (any hypervisor)
- Cloud to Cloud (AWS, Azure, GCP, etc. to Oracle)
- Simple workflow
- All databases seamlessly supported (including HANA)
- Many enterprise complexities handled
- Network Replication (NEW)

Steady State Protection

Disaster Recovery & Backup

RackWare CloudProtect is a Converged Disaster Recovery and Backup solution:

- Replicates your data and applications to geographically remote cloud locations
- Seamless Failover/Fallback
- Your DR sites doubles up as a Fast-Recovery Backup site
- Inbuilt incrementals capability extends this protection to Ransomware Recovery
- Great first use case for new Oracle customers

Planning Phase

Assessment

RackWare Assess allows you to Discover, Analyze and Monitor your workloads prior to, during and after a Cloud Transformation. Capabilities include:

- Server inventory
- Application Affinity
- Wave Planning
- CPU, Storage, Memory
- Cloud Cost Comparison
- Right-Sizing recommendations.
- Network Discovery (NEW)

Steady State Monitoring

Monitoring

RackWare Assess allows you to continue to Monitor your workloads post-migration:

- CPU, Memory Usage
- Right-Sizing recommendations
- Etc

RackWare™

RackWare

RackWare Any-to-Any Migration & DR

RackWare's ability to move and protect any workload from any Source to any to any target is enabling and accelerating Cloud Migration projects. RackWare supports migration to and from all of the below environments.

Operating Systems Support

- Windows Server 2008
- Red Hat 5.2 – 9.x
- ubuntu 10-22
- Windows Server 2012
- CentOS 5.2 – 9.x
- debian 8-11
- Microsoft Windows Server 2016
- ORACLE LINUX 5.2-9.x
- Amazon Linux
- SUSE 11-15
- Windows Server 2019
- Windows 10
- Rocky Linux 8-9
- Windows 2022
- Windows 7
- AlmaLinux 8-9

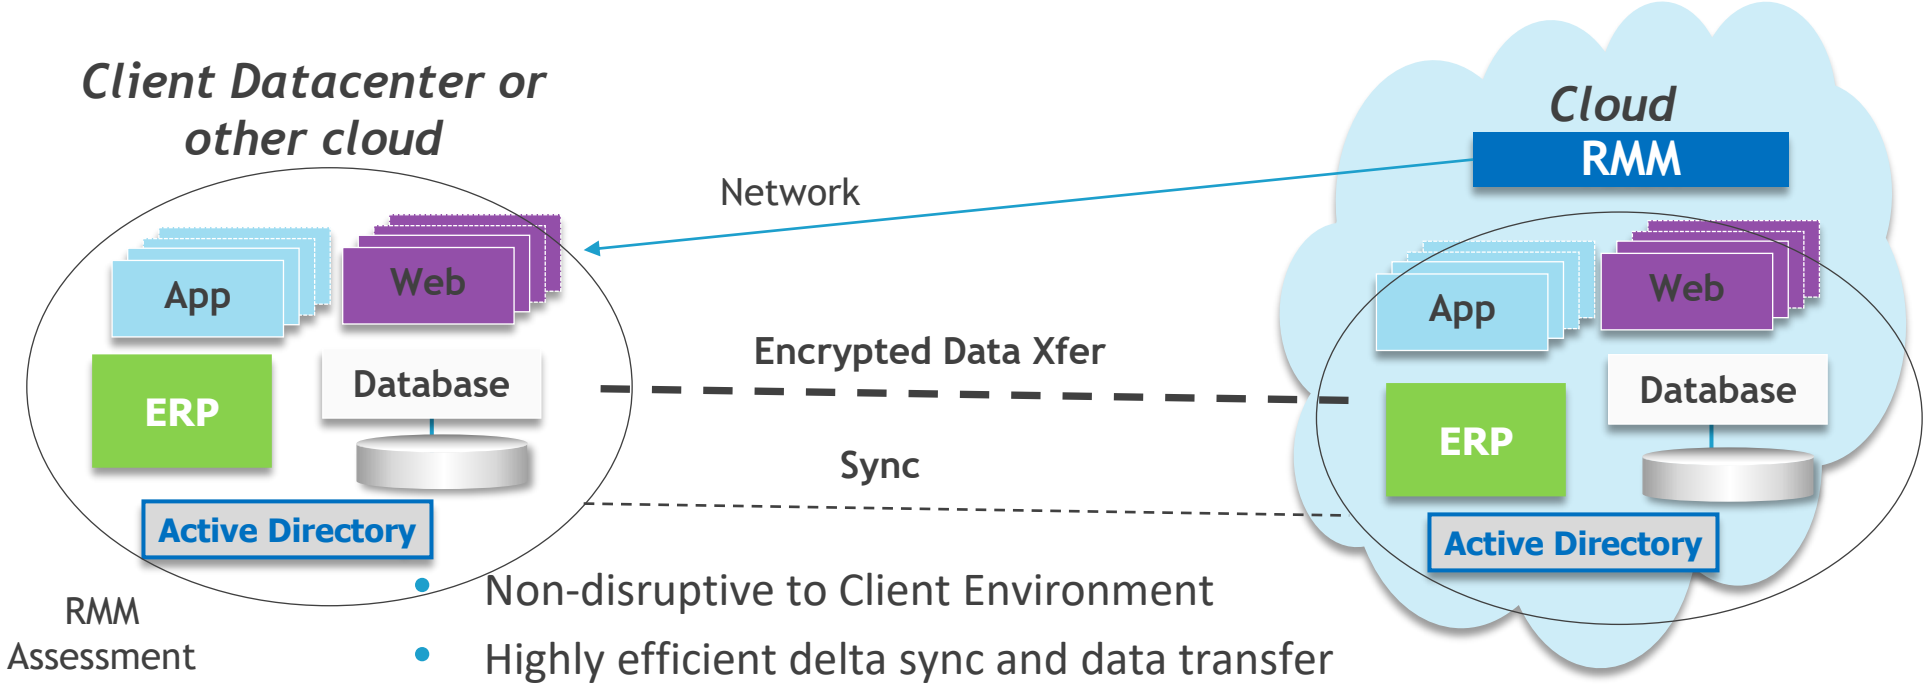
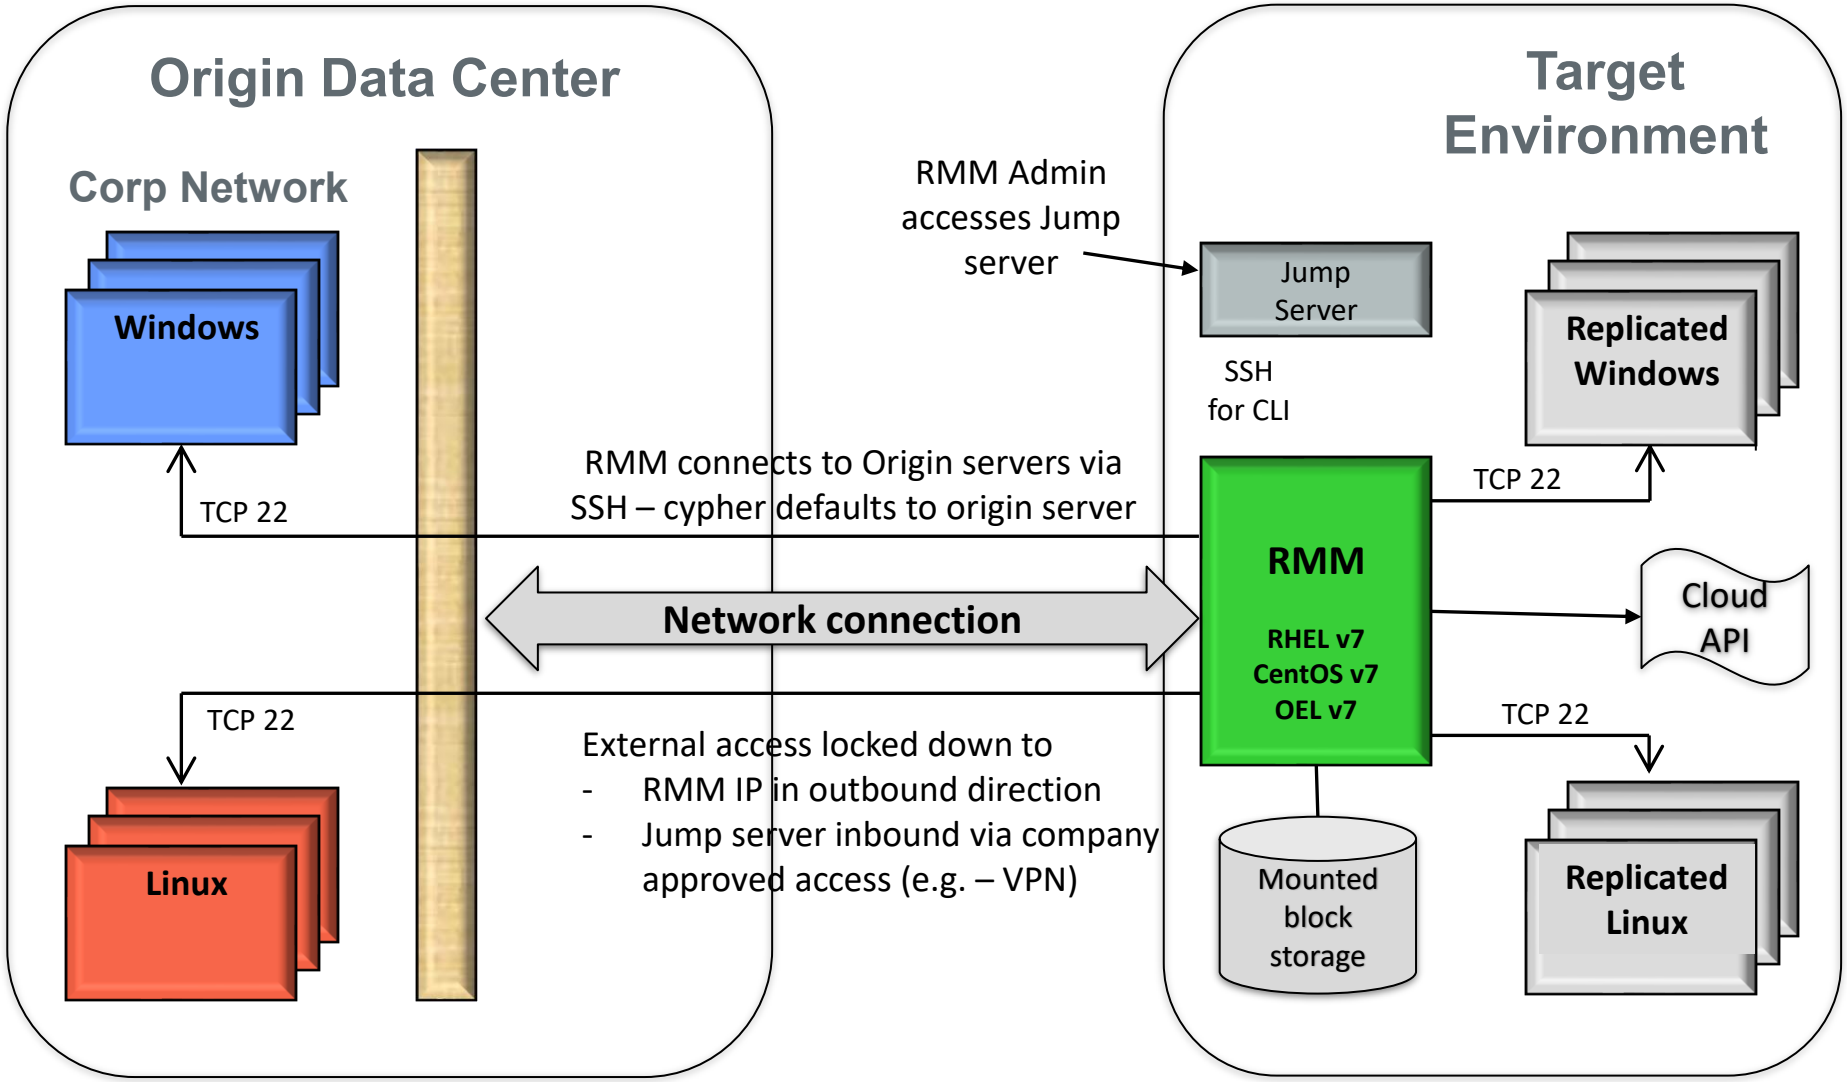
RMM Migration



RMM Assessment Analysis

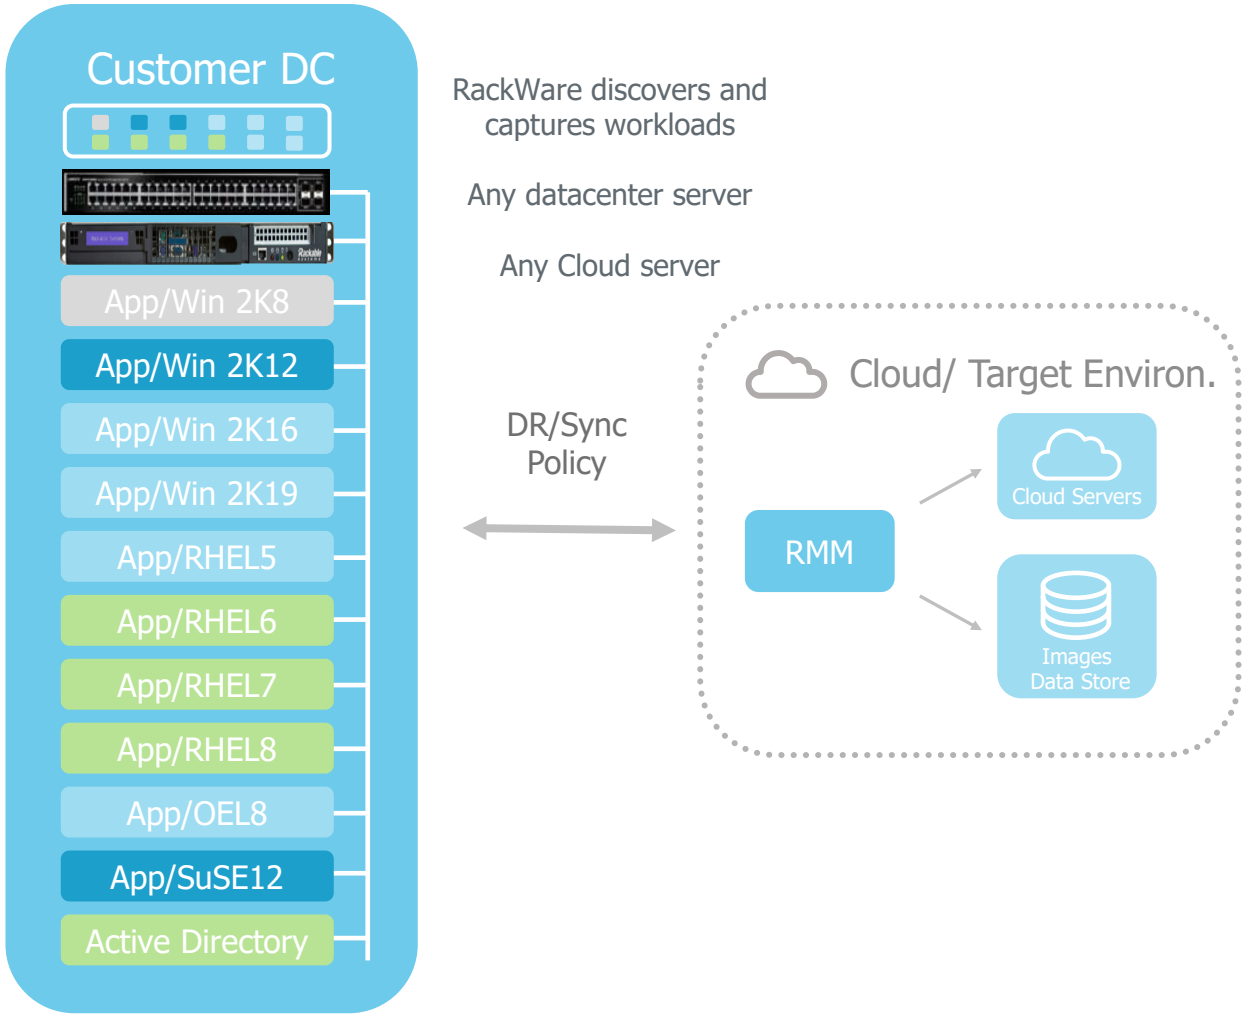
- Non-disruptive to Client Environment
- Highly efficient delta sync and data transfer
- Highly automated (provisioning, network, etc.)
- Easy testing without impacting Origin environment
- Cutover downtime less than an hour
- Features to support complex Enterprise environments

RMM HIGH LEVEL ARCHITECTURE



RMM supports any authentication mechanism supported by RHEL/OEL

Disaster Recovery Setup



Set DR Policy

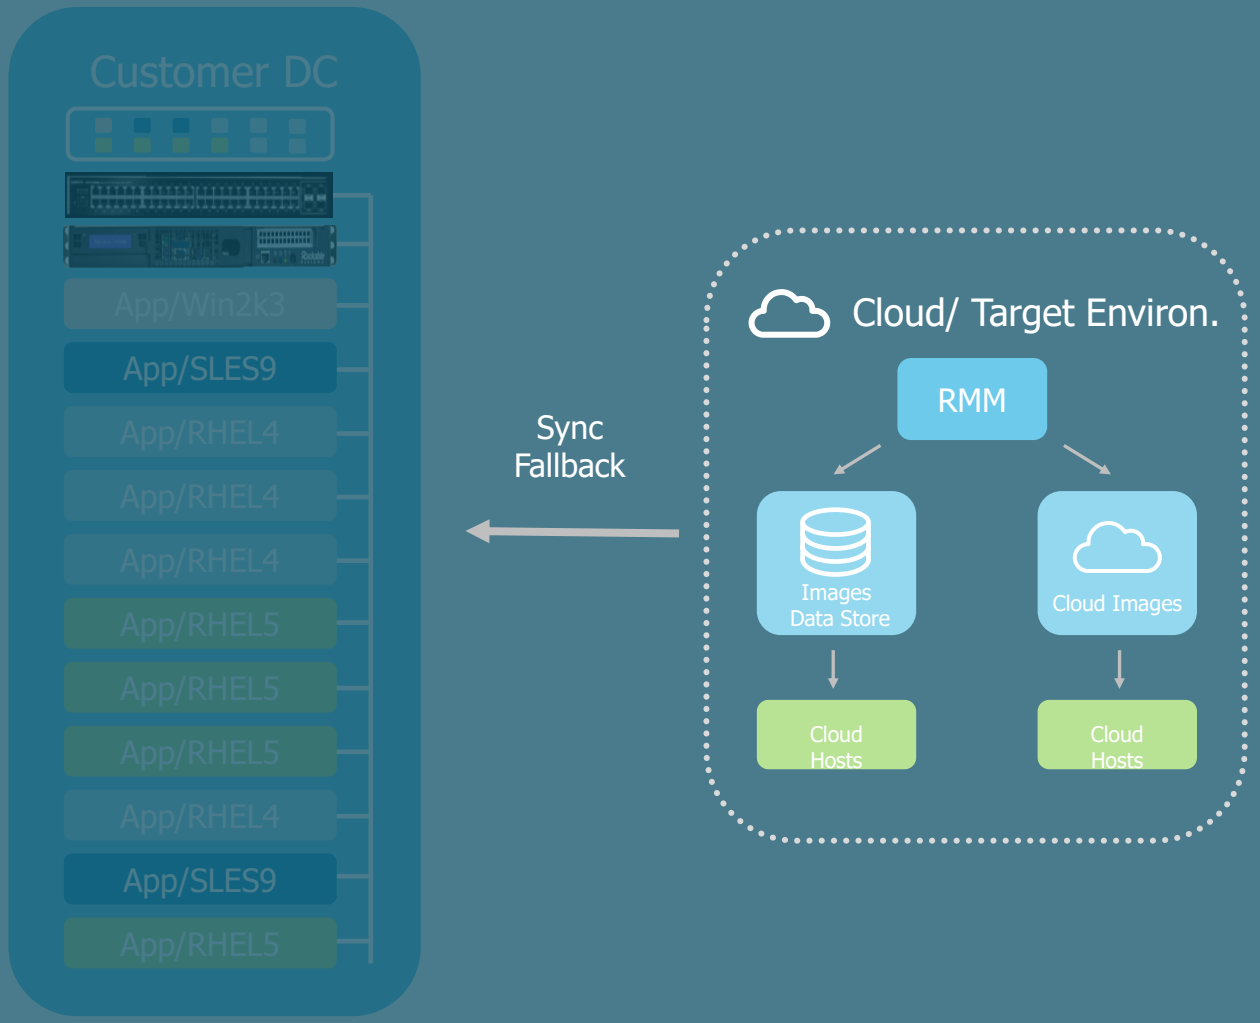
- Sophisticated Policy Engine
- Highly flexible based on app type and priority
- Cost/performance tradeoffs
- Recovery Point Objective (RPO)
- Type of Recovery Time Objective (RTO)
- Multiple policy can be configured and applied
- Pre & post scripts to glue together infrastructure

Highly automated

- Policy runs completely automated
- Automatic sync and alerts
- Dashboard and report generation

RackWare

Disaster Recovery Failover and Recovery



Failover

- Failover highly Automated (failover button)
- Pre-provisioned VMs available in minutes
- Other VMs Dynamically provisioned via API
- Policy executes scripts to configure infrastructure

Fallback

- Equally automated as failover
- Fallback is delta sync
- Fallback also supported if origin must be rebuilt

Test/Drill Mode

- Non-disruptive to production environment
- Performs all functions in Target environment
- Continue Sync'ing from the production during drill
- Easy clean up and resync after test

RPO/RTO/Cost Options and Tradeoffs

1 **Dynamic Provisioning**
Target VMs NOT pre-provisioned
Provisioned at DR event
Recovery process
- Provision server
- Complete replication
- Reboot server

Lowest cost
Longest RTO

2 **Pre-Provisioned – Powered On**
Pre-provision some/all VMs at production equivalent spec
Keep booted and in sync
Recovery process
- Reboot server

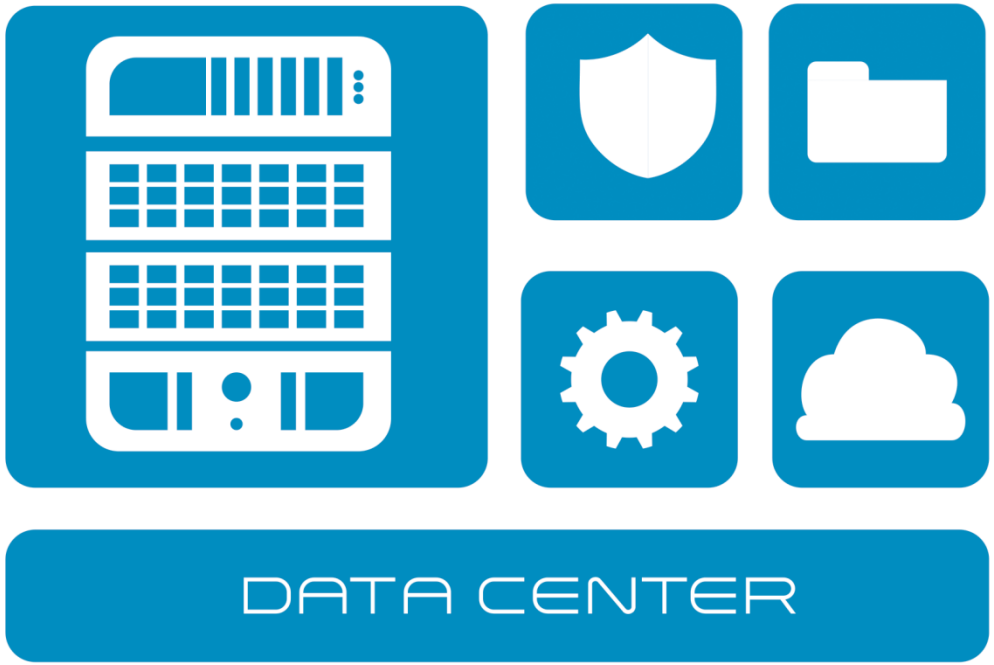
Highest cost
Best RTO

3 **Pre-Provisioned – Powered Off**
RPO achieved sync'ing to storage
Boot server once per week/month and sync
Recovery process
- Boot VM
- Stage 2 sync from storage to VMM
- Reboot server

Best compromise
Excellent cost & RTO

RackWare Benefits

- High level of automation
  - Less labor, less error, faster migrations
- Unified workflow for all use cases
  - No complex rules depending on Origin
- Cloud to Cloud
  - Any to any
- In Memory DBs and Apps
  - SAP/HANA, etc.
- Simple deployment architecture
  - No appliances or agents
- Non-disruptive testing in Target site
  - Efficient delta sync for rapid cutover
- Handles Enterprise complexities
  - Physical servers, iSCSI, Fibre Channel, etc.



*** Fastest path to Production

RackWare

RackWare DR & Backup Capabilities

- ✓ Easy graphical interface with configuration wizard(s)
- ✓ Common workflow and requirements across Linux and Windows VMs (and physical)
- ✓ Cloud to Cloud
- ✓ Accurate AutoProvisioning of Target servers based on Origin hardware discovery
- ✓ Automatically adaptable to changes in Origin servers (e.g. – new filesystems)
- ✓ Full UEFI – BIOS conversion
- ✓ Easy configuration of groups/waves with boot order and post boot delay
- ✓ Non-disruptive DR testing including individual apps and servers
- ✓ In Memory Application (e.g. SAP HANA), ERP, and DBs supported w/o app specific complications
- ✓ Dashboard, alerts, and compliance reporting
- ✓ Completely automate failover
- ✓ Equally automated fallback with delta sync (no requirement to copy all data)
- ✓ Options to tune cost to server priority RPO/RTO
- ✓ Easy to configure pre/post scripts for additional automation
- ✓ Integrated Backup functions (e.g. – retention policy, single file restore, etc.)

Thank You!
